

Nozzles 1000 & 2500

From simple to hard to reach fires, the original FlameFighter gets you to the source of the fire quickly. In just seconds, one or two firefighters can insert the FlameFighter nozzle into virtually any desired entry point and generate a high pressure spray. The "FlameFighter 1000" can be inserted two ways: first by swinging it like a battering ram, second by driving it in with a mallet.

Model 1000

Models 1000 and 2500 develop a 2400 sq. ft. waterball at 150 psi and have a max GPM of 320. Mounting brackets included.

Model 2500

This unit allows you to determine the length best suited for your

firefighting situation. Modular sections of 2', 3', 6' give you the lengths of your choice. Manufactured of the finest high quality steels and aircraft aluminum.
